REVISION

World Urbanization Prospects

[highlights]

Department of Economic and Social Affairs

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which States Members of the United Nations draw to review common problems and take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

Note

The designations employed in this report and the material presented in it do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Symbols of United Nations documents are composed of capital letters combined with figures.

World Urbanization Trends 2014: Key Facts

- Globally, more people live in urban areas than in rural areas, with 54 per cent of the world's population residing in urban areas in 2014. In 1950, 30 per cent of the world's population was urban, and by 2050, 66 per cent of the world's population is projected to be urban.
- Today, the most urbanized regions include Northern America (82 per cent living in urban areas in 2014), Latin America and the Caribbean (80 per cent), and Europe (73 per cent). In contrast, Africa and Asia remain mostly rural, with 40 and 48 per cent of their respective populations living in urban areas. All regions are expected to urbanize further over the coming decades. Africa and Asia are urbanizing faster than the other regions and are projected to become 56 and 64 per cent urban, respectively, by 2050.
- The rural population of the world has grown slowly since 1950 and is expected to reach its peak in a few years. The global rural population is now close to 3.4 billion and is expected to decline to 3.2 billion by 2050. Africa and Asia are home to nearly 90 per cent of the world's rural population. India has the largest rural population (857 million), followed by China (635 million).
- The urban population of the world has grown rapidly since 1950, from 746 million to 3.9 billion in 2014. Asia, despite its lower level of urbanization, is home to 53 per cent of the world's urban population, followed by Europe (14 per cent) and Latin America and the Caribbean (13 per cent).
- Continuing population growth and urbanization are projected to add 2.5 billion people to the world's urban population by 2050, with nearly 90 per cent of the increase concentrated in Asia and Africa.
- Just three countries—India, China and Nigeria— together are expected to account for 37 per cent of the projected growth of the world's urban population between 2014 and 2050. India is projected to add 404 million urban dwellers, China 292 million and Nigeria 212 million.
- Close to half of the world's urban dwellers reside in relatively small settlements of less than 500,000 inhabitants, while only around one in eight live in the 28 mega-cities with more than 10 million inhabitants.
- Tokyo is the world's largest city with an agglomeration of 38 million inhabitants, followed by Delhi with 25 million, Shanghai with 23 million, and Mexico City, Mumbai and São Paulo, each with around 21 million inhabitants. By 2030, the world is projected to have 41 mega-cities with more than 10 million inhabitants. Tokyo is projected to remain the world's largest city in 2030 with 37 million inhabitants, followed closely by Delhi where the population is projected to rise swiftly to 36 million. Several decades ago most of the world's largest urban agglomerations were found in the more developed regions, but today's large cities are concentrated in the global South. The fastest-growing urban agglomerations are medium-sized cities and cities with less than 1 million inhabitants located in Asia and Africa.
- Some cities have experienced population decline in recent years. Most of these are located in the low-fertility countries of Asia and Europe where the overall population is stagnant or declining. Economic contraction and natural disasters have contributed to population losses in some cities as well.
- As the world continues to urbanize, sustainable development challenges will be increasingly concentrated in cities, particularly in the lower-middle-income countries where the pace of urbanization is fastest. Integrated policies to improve the lives of both urban and rural dwellers are needed.

Introduction

In today’s increasingly global and interconnected world, over half of the world’s population (54 per cent) lives in urban areas although there is still substantial variability in the levels of urbanization across countries (figure 1). The coming decades will bring further profound changes to the size and spatial distribution of the global population. The continuing urbanization and overall growth of the world’s population is projected to add 2.5 billion people to the urban population by 2050, with nearly 90 per cent of the increase concentrated in Asia and Africa. At the same time, the proportion of the world’s population living in urban areas is expected to increase, reaching 66 per cent by 2050.

There is great diversity in the characteristics of the world’s urban environs: close to half of urban dwellers reside in relatively small settlements of less than 500,000 inhabitants, while nearly one in eight live in the 28 mega-cities of 10 million inhabitants or more. The number of mega-cities has nearly tripled since 1990; and by 2030, 41 urban agglomerations are projected to house at least 10 million inhabitants each. Whereas several decades ago most of the world’s largest urban agglomerations were found in the more developed regions, today’s large cities are concentrated in the global South, and the fastest-growing agglomerations are medium-sized cities and cities with 500,000 to 1 million inhabitants located in Asia and Africa.

Figure 1.
Percentage of population residing in urban areas in 2014, selected countries or areas

The process of urbanization historically has been associated with other important economic and social transformations, which have brought greater geographic mobility, lower fertility, longer life expectancy and population ageing. Cities are important drivers of development and poverty reduction in both urban and rural areas, as they concentrate much of the national economic activity, government, commerce and transportation, and provide crucial links with rural areas, between cities, and across international borders. Urban living is often associated with higher levels of literacy and education, better health, greater access to social services, and enhanced opportunities for cultural and political participation.

Nevertheless, rapid and unplanned urban growth threatens sustainable development when the necessary infrastructure is not developed or when policies are not implemented to ensure that the benefits of city life are equitably shared. Today, despite the comparative advantage of cities, urban areas are more unequal than rural areas and hundreds of millions of the world's urban poor live in sub-standard conditions. In some cities, unplanned or inadequately managed urban expansion leads to rapid sprawl, pollution, and environmental degradation, together with unsustainable production and consumption patterns.

Urbanization is integrally connected to the three pillars of sustainable development: economic development, social development and environmental protection. The outcome of the Rio+20 United Nations Conference on Sustainable Development, "The future we want" (<http://www.un.org/en/sustainablefuture/>), recognized both the plight of the urban poor and the need for sustainable cities as matters of great urgency for the United Nations development agenda. Building on that momentum, the third United Nations Conference on Human Settlements (Habitat III), planned for 2016, will bring together world leaders

Note: Countries or areas with 90,000 inhabitants or more in 2014.

to review the global urban agenda and to forge a new model of urban development that integrates all facets of sustainable development, to promote equity, welfare and shared prosperity in an urbanizing world.

Accurate, consistent and timely data on global trends in urbanization and city growth are critical for assessing current and future needs with respect to urban growth and for setting policy priorities to promote inclusive and equitable urban and rural development. In order to systematically track levels and trends in urbanization around the world, the Population Division of the Department of Economic and Social Affairs of the United Nations has issued, since 1988, biennial estimates and projections of the urban and rural populations of all countries and of the populations of major urban agglomerations.

This report presents the highlights of the *2014 Revision of World Urbanization Prospects*, which contains the latest estimates of the urban and rural populations of 233 countries or areas from 1950 to 2014 and projections to 2050, as well as estimates of population size from 1950 to 2014 and projections to 2030 for all urban agglomerations with 300,000 inhabitants or more in 2014.¹ The annex tables in these Highlights provide data on the estimated and projected urban and rural populations, the percentage of the population that live in urban areas and the annual growth rate of the percentage urban for 233 countries or areas of the world. The tables also show the rank and annual growth rate of urban agglomerations with 5 million inhabitants or more in 2014.

Data and methods

The estimates of the proportion of the population that is urban and the size of urban agglomerations presented in *World Urbanization Prospects: The 2014 Revision* are based on national statistics. Population censuses are the most commonly used sources of data, although estimates obtained from population registers or administrative statistics are also incorporated for some countries.

There is no common global definition of what constitutes an urban settlement. As a result, the urban definition employed by national statistical offices varies widely across countries, and in some cases has changed over time within a country. The criteria for classifying an area as urban may be based on one or a combination of characteristics, such as: a minimum population threshold; population density; proportion employed in non-agricultural sectors; the presence of infrastructure such as paved roads, electricity, piped water or sewers; and the presence of education or health services.

In estimating the proportion urban for *World Urbanization Prospects*, adjustments are made to the national estimates only to ensure consistency of the definitions of urban settlements within countries across time. No attempt is made to impose consistency in definitions across countries. Several efforts are underway at various institutions to produce globally comparable estimates of the urban population with uniform criteria to define urban areas based on satellite imagery of land cover or night-time lights, for example. However, these approaches have not generated, to date, the long historical time series of urbanization estimates required for this report. In interpreting the estimates and projections from *World Urbanization Prospects: The 2014 Revision*, readers should keep in mind the heterogeneity of the urban definition across countries.

¹ The full report, descriptions of the data, methodology, and complete data tables representing all countries and areas, regions, income groups, development groups, and periods can be accessed at <http://esa.un.org/unpd/wup/index.htm>.

In compiling information on city population size, the Population Division has endeavoured to use data or estimates based on the concept of urban agglomeration. When those data are not consistently available, population data that refer to the city as defined by its administrative boundaries were used. However, when the administrative boundaries of cities remain fixed for long periods of time, they are likely to misrepresent the actual growth of a city with respect to both its territory and its population. For a number of cities, the data available refer to two concepts: the city proper as defined by administrative boundaries and its metropolitan area. In those instances, the data referring to the metropolitan area were usually preferred because they are thought to approximate better the territory associated with the urban agglomeration. For any given city, an effort was made to ensure that the time series of population estimates derived from national sources conforms to the same definition over time. Adjustments were made when necessary to achieve internal consistency.

Since censuses are usually taken every 5 or 10 years, to fill the data gaps within the period 1950–2014, the estimates of the proportion urban and the city populations are interpolated or, for the interval between the last data point and 2014, the estimates are extrapolated from the last observed data point. For years beyond 2014, the proportion urban is projected to 2050 and the city populations are projected to 2030. The projection of the proportion urban is based on a projection of the urban-rural growth differential. It is assumed that the urban-rural growth difference for the most recent period available in a given country converges, over a period of 25 years, to a hypothetical urban-rural growth difference, or world norm, that is consistent with historical experience. The method to project city populations is similar, as the last observed city growth rate converges towards an expected value, estimated on the basis of the city population and the growth rate of the overall urban population in the country.

The estimated and projected values of the proportion urban from 1950 to 2050 for each country or area were then applied to the total population as estimated or projected in the medium variant in *World Population Prospects: The 2012 Revision* (United Nations, 2013a) in order to obtain country-level estimates of the urban and rural populations. The *2014 Revision of World Urbanization Prospects* updates and supersedes all previous estimates and projections of urban and rural populations and of urban agglomerations published by the United Nations.

Trends in urbanization

Globally, more people live in urban areas than in rural areas. In 2007, for the first time in history, the global urban population exceeded the global rural population, and the world population has remained predominantly urban thereafter (figure 2). The planet has gone through a process of rapid urbanization over the past six decades. In 1950, more than two-thirds (70 per cent) of people worldwide lived in rural settlements and less than one-third (30 per cent) in urban settlements. In 2014, 54 per cent of the world's population is urban. The urban population is expected to continue to grow, so that by 2050, the world will be one-third rural (34 per cent) and two-thirds urban (66 per cent), roughly the reverse of the global rural-urban population distribution of the mid-twentieth century (also see Annex Table I).

Figure 2.
Urban and rural population of the world, 1950–2050

A majority of the world's population lives in urban areas

Levels of urbanization vary greatly across regions. In 2014, high levels of urbanization, at or above 80 per cent, characterized Latin America and the Caribbean and Northern America. Europe, with 73 per cent of its population living in urban areas, is expected to be over 80 per cent urban by 2050 (figure 3). Africa and Asia, in contrast, remain mostly rural, with 40 per cent and 48 per cent of their respective populations living in urban areas. Over the coming decades, the level of urbanization is expected to increase in all regions (also referred to as major areas), with Africa and Asia urbanizing faster than the rest. Nevertheless, these two regions, which are projected to reach 56 and 64 per cent urban by mid-century, respectively, are still expected to be less urbanized than other regions of the world.

Urbanization has occurred in all major areas, yet Africa and Asia remain mostly rural

Figure 3. Urban and rural population as proportion of total population, by major areas, 1950–2050

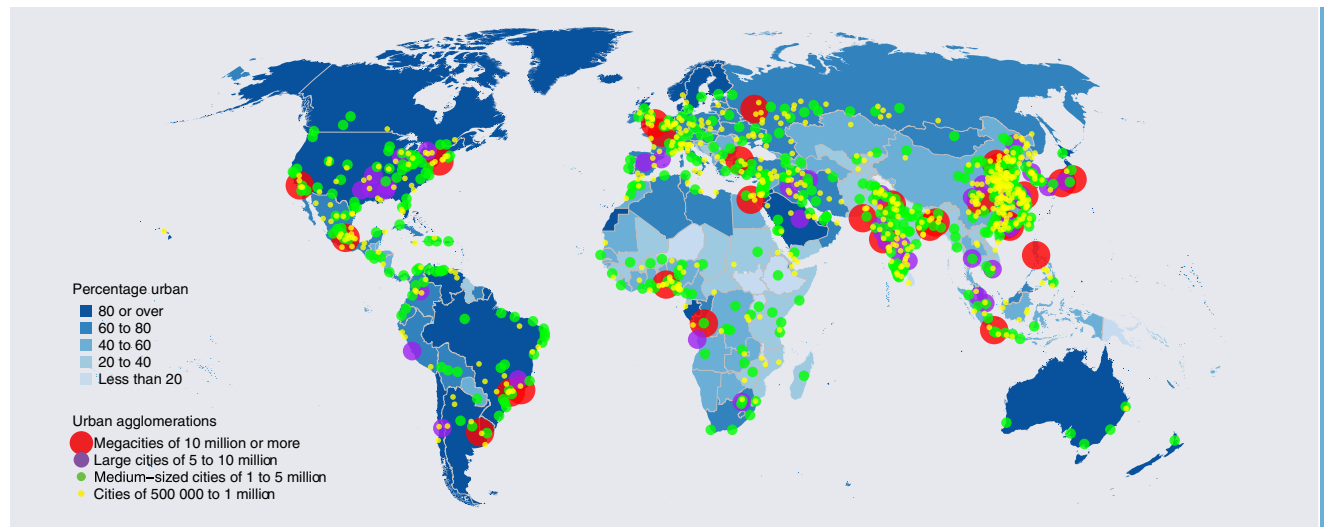

In 2014, sixteen countries still have low levels of urbanization, i.e. below 20 per cent. The largest among them, with total populations of 10 million inhabitants or more, include Burundi, Ethiopia, Malawi, Niger, South Sudan and Uganda in Africa and Nepal and Sri Lanka in Asia (see Map 1). By 2050, all of these countries are expected to become significantly more urbanized, with as much as twice their respective proportions urban in 2014. In contrast, 59 countries are already more than 80 per cent urban. Among those with populations of at least 10 million inhabitants, the most highly urbanized countries are Belgium (98 per cent urban), Japan (93 per cent), Argentina (92 per cent) and the Netherlands (90 per cent). By 2050, 89 countries are expected to become more than 80 per cent urban. When interpreting the differences in levels of urbanization across countries, it is important to keep in mind the heterogeneity of the urban definition across countries.

Africa and Asia are urbanizing more rapidly than other regions of the world. The rate of urbanization, measured as the average annual rate of change of the percentage urban, is highest in Asia and Africa, where currently the proportion urban is increasing by 1.5 and 1.1 per cent per annum, respectively. Regions that already have relatively high levels of urbanization are urbanizing at a slower pace, at less than 0.4 per cent annually (figure 4). In general, the pace of urbanization tends to slow down as a population becomes more urbanized.

Map 1.

Percentage urban and location of urban agglomerations with at least 500,000 inhabitants, 2014

Note: The designations employed and the presentation of material on this map do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Figure 4.

Average annual rate of change of the percentage urban by major areas, 1950–2050

There has been considerable variation across regions in rates of urbanization since 1950. The rate of urbanization in Asia fluctuated widely, mainly as a result of a stagnation of the urbanization process in China in the late 1960s and early 1970s, and its subsequent upturn. Europe, Northern America and Oceania, on the other hand, each experienced a period of stable urbanization, and overall their rate of urbanization has been slow over the last two decades. In Latin America and the Caribbean, the rate of urbanization has declined smoothly over the past six decades. Africa is currently urbanizing faster than in the late 1990s and is expected to be the fastest urbanizing region from 2020 to 2050. Urbanization in developing countries has proceeded faster than in developed countries, but the correlation of the rate of urbanization with economic growth has been weaker than in developed countries (United Nations, 2013b).

Upper-middle-income countries have experienced the fastest pace of urbanization

High-income countries —
 Upper-middle-income countries —
 Lower-middle-income countries —
 Low income countries —

Note: The country classification by income level is based on 2012 GNI per capita from the World Bank and it is kept unchanged throughout the estimates and projections.

Figure 5.

Proportion urban by income groups, 1950–2050

In the lower-middle- and low-income countries, the pace of urbanization has been slower until now. Nevertheless, this group of countries is expected to experience faster urbanization than others in the coming decades. In 2014, the proportion of the population living in urban areas was 39 percent in lower-middle-income countries and 30 per cent in low-income countries. By 2050, these countries are expected to reach, on average, 57 and 48 per cent urban, respectively.

The rural population of the world has grown slowly since 1950 and is expected to reach its peak in a few years. Approximately 3.4 billion people currently live in rural areas around the world. That number is expected to remain relatively constant in the coming years. However, sometime after 2020, the world's rural population will start to decline and is expected to reach 3.2 billion in 2050. This global trend is driven mostly by the dynamics of rural population growth in Africa and Asia, which is home today to nearly 90 per cent of the world's rural population (figure 6a). The rural population of the world resides in a relatively small number of countries. India has the largest rural population (857 million), followed by China (635 million). Together, these two countries account for 45 per cent of the world's rural population. Bangladesh, Indonesia and Pakistan follow, each with over 100 million rural inhabitants. In Africa, the largest rural populations are located in Nigeria (95 million) and Ethiopia (78 million). Between 2014 and 2050, the rural population is expected to increase in about one third of the countries of the world. The largest increases will be registered in Nigeria (50 million), Ethiopia and Uganda (39 and 38 million). The remaining two thirds of countries are expected to have stable or declining rural populations. The largest declines are expected in China, with a decline of 300 million, equivalent to more than one half of their rural population in 2014, and in India, where the number of rural residents is expected to decline by 52 million.

Figure 6a.

A vast majority of the world's rural inhabitants live in Asia, but projected growth is fastest in Africa

Figure 6b.

Asia will continue to host nearly one half of the world's urban population

The urban population of the world is expected to increase by more than two thirds by 2050, with nearly 90 per cent of the increase to take place in the urban areas of Africa and Asia. The world's urban population is now close to 3.9 billion and is expected to reach 6.3 billion in 2050. Asia, despite its lower level of urbanization, is today home to 53 per cent of the urban population in the world. Europe has the second highest share of the world's urban population, at 14 per cent, followed by Latin America and the Caribbean with 13 per cent (figure 6b). Over the next four decades, Africa and Asia will experience a marked increase in their urban populations. By mid-century, the urban population of Africa is likely to triple and that of Asia to increase by 61 per cent. As a consequence, close to 90 per cent of the increase in the world's urban population will take place in the urban areas of Africa and Asia. In 2050, most of the urban population of the world will be concentrated in Asia (52 per cent) and Africa (21 per cent).

Just a few countries are home to half of the world’s urban population. China has the largest urban population (758 million), followed by India (410 million). These two countries account for 30 per cent of the world’s urban population and, with another five countries, the United States of America (263 million), Brazil (173 million), Indonesia (134 million), Japan (118 million) and the Russian Federation (105 million), account for more than half of the world’s urban population.

Future increases in the world’s urban population are also expected to be highly concentrated in just a few countries (figure 7). Taken together, China, India and Nigeria are projected to account for 37 per cent of the increase of nearly 2.5 billion people in the urban population by 2050. Between 2014 and 2050, the urban areas are expected to grow by 404 million people in India, 292 million in China and 212 million in Nigeria. Seven other countries, the Democratic Republic of Congo, Ethiopia, the United Republic of Tanzania, Bangladesh, Indonesia and Pakistan, and the United States of America, are projected to contribute more than 50 million each to the urban increment and will constitute together another 20 per cent of the total increase in urban population. In a few countries, the urban population will decrease, despite projected increases in the level of urbanization. The largest declines between 2014 and 2050 are projected for Japan, with a decline of 12 million urban dwellers and for the Russian Federation, expected to decline by 7 million.

China and India will contribute more than one third of the global urban population increase between 2014 and 2050

Figure 7. Contribution to the increase in urban population by country, 2014 to 2050

Note: The countries shown are projected to contribute 25 million or more to the global urban increment between 2014 and 2050. The category “Other countries” includes countries with urban increments of less than 25 million each.

Cities

Megacities are notable for their size and concentration of economic activity, but are home to only about one in eight of the world's urban dwellers. In 1990 there were 10 cities with more than 10 million inhabitants (figure 8), and these so-called “megacities” were home to 153 million people, representing less than 7 per cent of the global urban population. Today, the number of megacities has nearly tripled to 28, the population they contain has grown to 453 million, and these agglomerations now account for 12 per cent of the world's urban dwellers. Tokyo is the world's largest city with an agglomeration of 38 million inhabitants, followed by Delhi with 25 million, Shanghai with 23 million, and Mexico City, Mumbai and São Paulo, each with around 21 million inhabitants. By 2020, Tokyo's population is projected to begin to decline, although it will remain the world's largest agglomeration in 2030 with 37 million inhabitants, followed closely by Delhi, whose population is projected to rise swiftly to 36 million (figure 9). While Osaka (Kinki Major Metropolitan Area) and New York-Newark were the world's second and third largest urban agglomerations in 1990, by 2030 they are projected to fall in rank to the 13th and 14th positions, respectively (Annex Table II).

Figure 8.

Global urban population growth is propelled by the growth of cities of all sizes

Large cities with 5 to 10 million inhabitants account for a small, but growing proportion of the global urban population. In 2014, just over 300 million people live in the 43 “large” cities with 5 to 10 million inhabitants, which include such cities as Santiago (Chile), Madrid (Spain), and Singapore. Large cities currently account for 8 per cent of the urban population of the world. The number of such cities is expected to grow to 63 by 2030 and house more than 400 million people, representing close to 9 per cent of the global urban population. The proportion of the urban population concentrated in megacities and cities with 5 to 10 million inhabitants in 2014 varies widely across major areas, from 0 per cent in Oceania to 25 per cent in Northern America (figure 10).

Figure 9.

The ten largest urban agglomerations in 2014 show varied growth patterns both in the recent past and in future projections

Figure 10.

Population distribution by city size varies across major areas in 2014

Most megacities and large cities are located in the global South. China alone has six megacities and ten cities with populations between 5 and 10 million in 2014, and it will add one more megacity and six more large cities by 2030. Four of India's cities with 5 to 10 million inhabitants presently are projected to become megacities in the coming years (Ahmadabad, Bangalore, Chennai and Hyderabad), for a total of seven megacities projected in the country by 2030. Outside of China and India, Asia has seven other megacities and eleven other large cities in 2014. Cairo, Kinshasa and Lagos are the only megacities in Africa in 2014, but three more are expected to emerge by 2030, as Dar es Salaam (Tanzania), Johannesburg (South Africa), and Luanda (Angola) are each projected to surpass the 10 million mark. The number of large cities with populations between 5 and 10 million in Africa is also expected to increase, from three in 2014 to twelve in 2030. In Latin America, Bogotá (Colombia) and Lima (Peru) are projected to grow beyond the 10 million mark by 2030, joining the four current megacities of the region: Buenos Aires, Mexico City, Rio de

Janeiro, and São Paulo. Notably, there are varying degrees of uncertainty in the projections of cities, with greater uncertainty for cities like Kinshasa or Luanda where census data have not been collected or reported in decades.

One in five urban dwellers worldwide lives in a medium-sized city with 1 million to 5 million inhabitants. While considered medium-sized by global standards, these cities are, in fact, the largest cities in 79 countries or areas. Examples include Sydney (Australia), Addis Ababa (Ethiopia), and Montevideo (Uruguay). The global population living in medium-sized cities nearly doubled between 1990 and 2014, and is expected to increase by another 36 per cent between 2014 and 2030, growing from 827 million to 1.1 billion. The number of people living in cities of between 500,000 and 1 million inhabitants is expected to grow at a similar pace, increasing from 363 million in 2014 to 509 million in 2030, but continuing to hold only around 10 per cent of the global urban population.

In 2014 close to one half of the world's urban population lives in settlements with fewer than 500,000 inhabitants. While this proportion is projected to shrink over time, by 2030 these small cities and towns will still be home to around 45 per cent of urban dwellers. The proportion of the urban population in small cities varies considerably across regions. Close to two thirds of Europe's urban dwellers reside in small urban places as do more than half of Africa's urban dwellers. In contrast, just one third of urban residents in Northern America live in settlements with fewer than 500,000 people. Regional differences also reflect differences in settlement patterns, as well as variations in the definition of urban areas across countries and regions.

The fastest growing urban agglomerations are medium-sized cities and cities with less than 1 million inhabitants located in Asia and Africa. Between 2000 and 2014 the world's cities with more than 500,000 inhabitants grew at an average annual rate of 2.4 per cent. However, 43 of these cities grew more than twice as fast, with average growth rates in excess of 6 per cent per year (figure 11). Of these, 4 are located in Africa, 38 in Asia (18 in China alone), and 1 in Northern America. By way of comparison, Suzhou, in China's Jiangsu Province, is the only city with more than 5 million inhabitants to have experienced such rapid growth. In general, most of the world's fastest growing urban agglomerations are smaller cities: agglomerations with 500,000 to 1 million inhabitants in 2014 account for 26 of the 43 fastest-growing cities, while another 16 are medium-sized cities with between 1 million and 5 million inhabitants.

Some cities have experienced population decline since 2000, most of which are located in low-fertility countries of Asia and Europe with stagnating or declining populations. A few cities in Japan and the Republic of Korea (for example, Nagasaki and Busan) have experienced population decline between 2000 and 2014. Several cities in the Russian Federation and Ukraine have lost population since 2000 as well. In addition, several capital cities around the world have seen their populations decline between 2000 and 2014, including Bratislava (Slovakia), Riga (Latvia), Sarajevo (Bosnia and Herzegovina) and Yerevan (Armenia). In addition to low fertility, emigration has also contributed to smaller population sizes in some of these cities.

Economic contraction and natural disasters have contributed to population loss in some cities. In the United States, for example, Buffalo and Detroit each experienced net losses of population between 2000 and 2014, concurrent with a loss of industry and jobs in those cities, while New Orleans experienced population decline in the wake of the 2005 Hurricane Katrina.

Figure 11.
The world's fastest growing cities are in Africa and Asia

Policy implications

As the world continues to urbanize, sustainable development challenges will be increasingly concentrated in cities, particularly in the lower-middle-income countries where the pace of urbanization is fastest. At the same time, cities offer opportunities to expand access to services, such as health care and education, for large numbers of people in an economically efficient manner. Providing public transportation, as well as housing, electricity, water and sanitation for a densely settled population is typically cheaper and less environmentally damaging than providing a similar level of services to a predominantly rural household. Urban dwellers also have access to larger and more diversified labour markets, and enjoy healthier lives overall.

Governments must implement policies to ensure that the benefits of urban growth are shared equitably and sustainably. The Rio +20 Conference outcome, “The future we want”, recognized that cities can lead the way towards economically, socially and environmentally sustainable societies, but that a holistic approach to urban planning and management is needed to improve living standards of urban and rural dwellers alike. Sustainable urbanization requires that cities generate better income and employment opportunities, expand the necessary infrastructure for water and sanitation, energy, transportation, information and communications; ensure equal access to services; reduce the number of people living in slums; and preserve the natural assets within the city and surrounding areas.

Diversified policies to plan for and manage the spatial distribution of the population and internal migration are needed. History has shown that policies that aim to restrict rural-urban migration are ineffective at forestalling city growth, and can even produce economic, social and environmental harms. In recent years, a growing number of countries have been favouring other strategies for rural and urban development, such as allocating land rights, managing land use, land redistribution, creating regional development zones and promoting economic diversification and competitiveness in rural areas through the mobilization of investment and the improvement of rural livelihoods.²

Policies aimed at a more balanced distribution of urban growth, avoiding excessive concentration in just one or two very large urban agglomerations within a single country, can also support sustainable development. These policies, as well as those promoting the growth of intermediate-size cities common in Latin America, can help to address the problems of excessive centralization of economic and administrative functions, while also responding to the challenges of providing urban infrastructure and basic social services for the urban poor, and mitigating the negative environmental impacts often associated with large and rapidly growing urban agglomerations.

² United Nations (2008) *World Population Monitoring, focusing on population distribution, urbanization, internal migration and development*. Report of the Secretary-General to the forty-first session of the Commission on Population and Development, E/CN.9/2008/3

Accurate, consistent and timely data on global trends in urbanization and city growth are critical for assessing current and future needs with respect to urban growth and for setting policy priorities to promote inclusive and equitable urban and rural development. In order to systematically track levels and trends in urbanization around the world and to monitor progress in sustainable development goals in urban and rural areas, Governments, with the support of international cooperation, should continue their efforts to produce more extensive and better quality data on the size, distribution and characteristics of the population.

Successful sustainable urbanization requires competent, responsive and accountable governments charged with the management of cities and urban expansion, as well appropriate use of information and communication technologies (ICTs) for more efficient service delivery. There is a need for building institutional capacities and applying integrated approaches so as to attain urban sustainability.

Notes

- a More developed regions comprise Europe, Northern America, Australia/New Zealand and Japan.
- b Less developed regions comprise all regions of Africa, Asia (excluding Japan), Latin America and the Caribbean plus Melanesia, Micronesia and Polynesia.
- c The least developed countries are 49 countries, 34 in Africa, 9 in Asia, 5 in Oceania plus one in Latin America and the Caribbean.
- d Other less developed countries comprise the less developed regions excluding the least developed countries.
- e The country classification by income level is based on 2012 GNI per capita from the World Bank.
- f Sub-Saharan Africa refers to all of Africa except Northern Africa.
- 1 Including Agalega, Rodrigues, and Saint Brandon.
- 2 Including Zanzibar.
- 3 Including Ascension, and Tristan da Cunha.
- 4 For statistical purposes, the data for China do not include Hong Kong and Macao, Special Administrative Regions (SAR) of China.
- 5 As of 1 July 1997, Hong Kong became a Special Administrative Region (SAR) of China.
- 6 As of 20 December 1999, Macao became a Special Administrative Region (SAR) of China.
- 7 The regions Southern Asia and Central Asia are combined into South-Central Asia.
- 8 Including Sabah and Sarawak.
- 9 Including Nagorno-Karabakh.
- 10 Including Abkhazia and South Ossetia.
- 11 Including East Jerusalem.
- 12 Including Transnistria.
- 13 Refers to Guernsey, and Jersey.
- 14 Including Åland Islands.
- 15 Including Svalbard and Jan Mayen Islands.
- 16 Refers to the Vatican City State.
- 17 Including Kosovo.
- 18 Including Canary Islands, Ceuta and Melilla.
- 19 The former Yugoslav Republic of Macedonia.
- 20 Including Saint-Barthélemy and Saint-Martin (French part).
- 21 Including Christmas Island, Cocos Keeling Islands, and Norfolk Island.
- 22 Including Pitcairn.

Table II

Population size and ranking of urban agglomerations with more than 5 million inhabitants as of 1 July 2014

Urban Agglomeration	Country or area	Population (thousands)			Rank			Average annual rate of change (per cent) 2010–2015

Accurate, consistent and timely data on global trends in urbanization and city growth are critical for assessing current and future needs with respect to urban growth and for setting policy priorities to promote inclusive and equitable urban and rural development. This report presents the highlights of the 2014 Revision of World Urbanization Prospects, which contains the latest estimates of the urban and rural populations of 233 countries or areas from 1950 to 2014 and projections to 2050, as well as estimates of population size from 1950 to 2014 and projections to 2030 for all urban agglomerations with 300,000 inhabitants or more in 2014.
